Motivation

- Locate and fix faults
- Refactor code
- Extend functionality
- Merge versions
- ...

Motivation

The screenshot shows a Java IDE interface with two panes for code comparison.

Java Structure Compare: Shows a tree view of the code structure. The root node is a Compilation Unit containing a class named SENP, which has a method named readAttribute(Tokenizer).

Java Source Compare: Compares two files: SIR-SienaV1/src/siena/SENP.java and SIR-SienaV2/src/siena/SENP.java.

SIR-SienaV1/src/siena/SENP.java:

```
700 }
701
702 private static AttributeValue readAttribute(Tokenizer t)
703 throws SENPInvalidFormat {
704     switch(t.nextToken()) {
705         case Tokenizer.T_STR: return new AttributeValue(t.stringValue());
706         case Tokenizer.T_INT: return new AttributeValue(t.intValue());
707         case Tokenizer.T_BOOL: return new AttributeValue(t.booleanValue());
708         case Tokenizer.T_DOUBLE: return new AttributeValue(t.doubleValue());
709     default:
710         throw(new SENPInvalidFormat("<int>, <string>, <bool>"));
711     }
712 }
713
714 private static AttributeConstraint readAttributeCons...
```

SIR-SienaV2/src/siena/SENP.java:

```
700 }
701
702 private static AttributeValue readAttribute(Tokenizer t)
703 throws SENPInvalidFormat {
704     switch(t.nextToken()) {
705         case Tokenizer.T_ID: return new AttributeValue(t.stringValue());
706         case Tokenizer.T_STR: return new AttributeValue(t.stringValue());
707         case Tokenizer.T_INT: return new AttributeValue(t.intValue());
708         case Tokenizer.T_BOOL: return new AttributeValue(t.booleanValue());
709         case Tokenizer.T_DOUBLE: return new AttributeValue(t.doubleValue());
710     default:
711         throw(new SENPInvalidFormat("<int>, <string>, <bool>"));
712     }
713 }
714
715 private static AttributeConstraint readAttributeCons...
```

The code in SIR-SienaV2 has been modified to use T_ID instead of T_STR for string values. The Java Structure Compare pane shows the original code structure, while the Java Source Compare pane highlights the differences in the code itself.

Motivation

Java Source Compare

DSE/src/Logical1.java

```
4     int old;
5     int[] data;
6
7 public int logicalValue(int t){
8     if (!(currentTime - t >= 100)){
9         return old;
10    }else{
11        int val = 0;
12        for (int i=0; i<data.length; i++){
13            val = val + data[i];
14        }
15        old = val;
16        return val;
17    }
18}
19
20
```

DSE/src/Logical2.java

```
4     int old;
5     int[] data;
6
7 final int THRESHOLD = 100;
8 public int logicalValue(int t){
9     int elapsed = currentTime - t;
10    int val = 0;
11    if (elapsed < THRESHOLD){
12        val = old;
13    }else{
14        for (int i=0; i<data.length; i++){
15            val = val + data[i];
16        }
17        old = val;
18    }
19    return val;
20}
```

Differential Symbolic Execution (DSE)

- Detect and characterize the effects of program changes in terms of *behavioral* differences between program versions

Symbolic
Execution

Over-approximating
Symbolic Summaries

Differential Symbolic Execution (DSE)

Java Source Compare

DSE/src/Logical1.java

```
4 int old;
5 int[] data;
6
7 public int logicalValue(int t){
8     if (!(currentTime - t >= 100)){
9         return old;
10    }else{
11        int val = 0;
12        for (int i=0; i<data.length;
13            val = val + data[i];
14        )
15        old = val;
16        return val;
17    }
18}
19
20
```

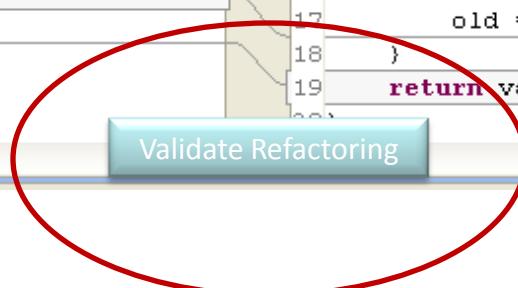

DSE/src/Logical2.java

```
4 int old;
5 int[] data;
6
7 final int THRESHOLD = 100;
8 public int logicalValue(int t){
9     if (currentTime - t >=
10        THRESHOLD) {
11            int val = 0;
12            for (int i=0; i<data.length; i++){
13                val = val + data[i];
14            )
15            old = val;
16        }
17    }
18    return val;
19
20
```

No functional differences found.

Overview of Presentation

- DSE methodology
- Summaries of program behavior
- Notions of equivalence and deltas
- Applications of DSE
- Related work
- Conclusions and future work

Symbolic Execution

```
int m(int y){  
1: if (y > 0)  
2:   y++;  
3: else  
4:   y--;  
5: return y;  
}
```

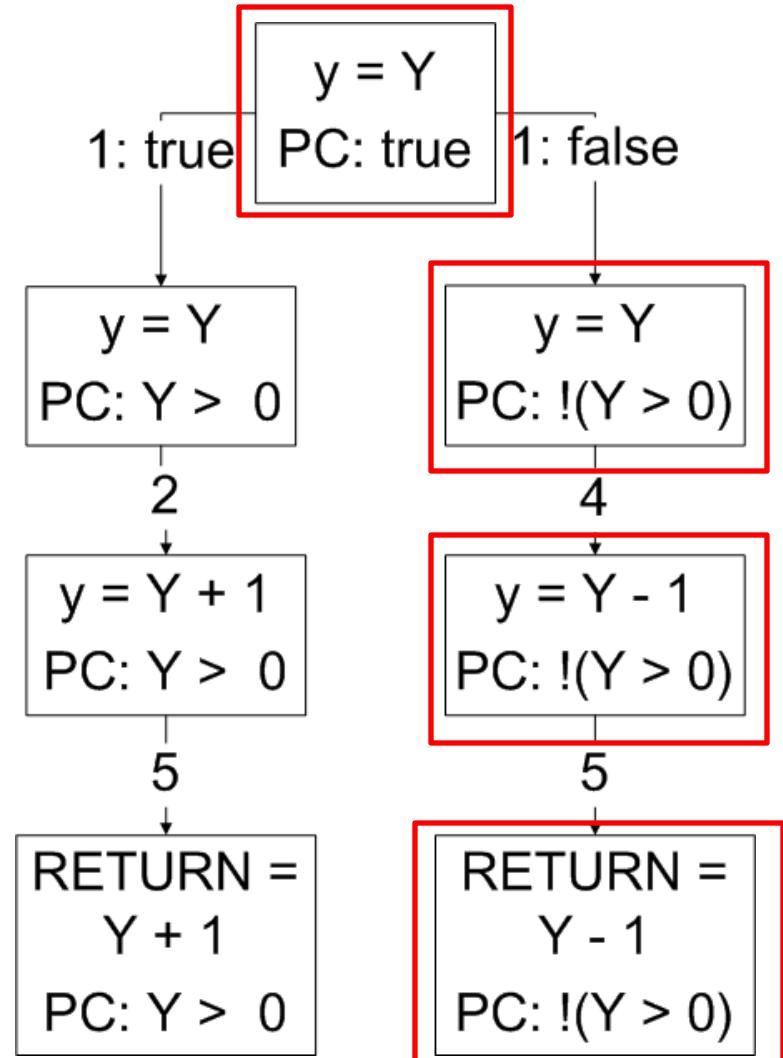

$m_{sum} =$
 $\{(Y > 0, \text{RETURN} == Y+1)\}$

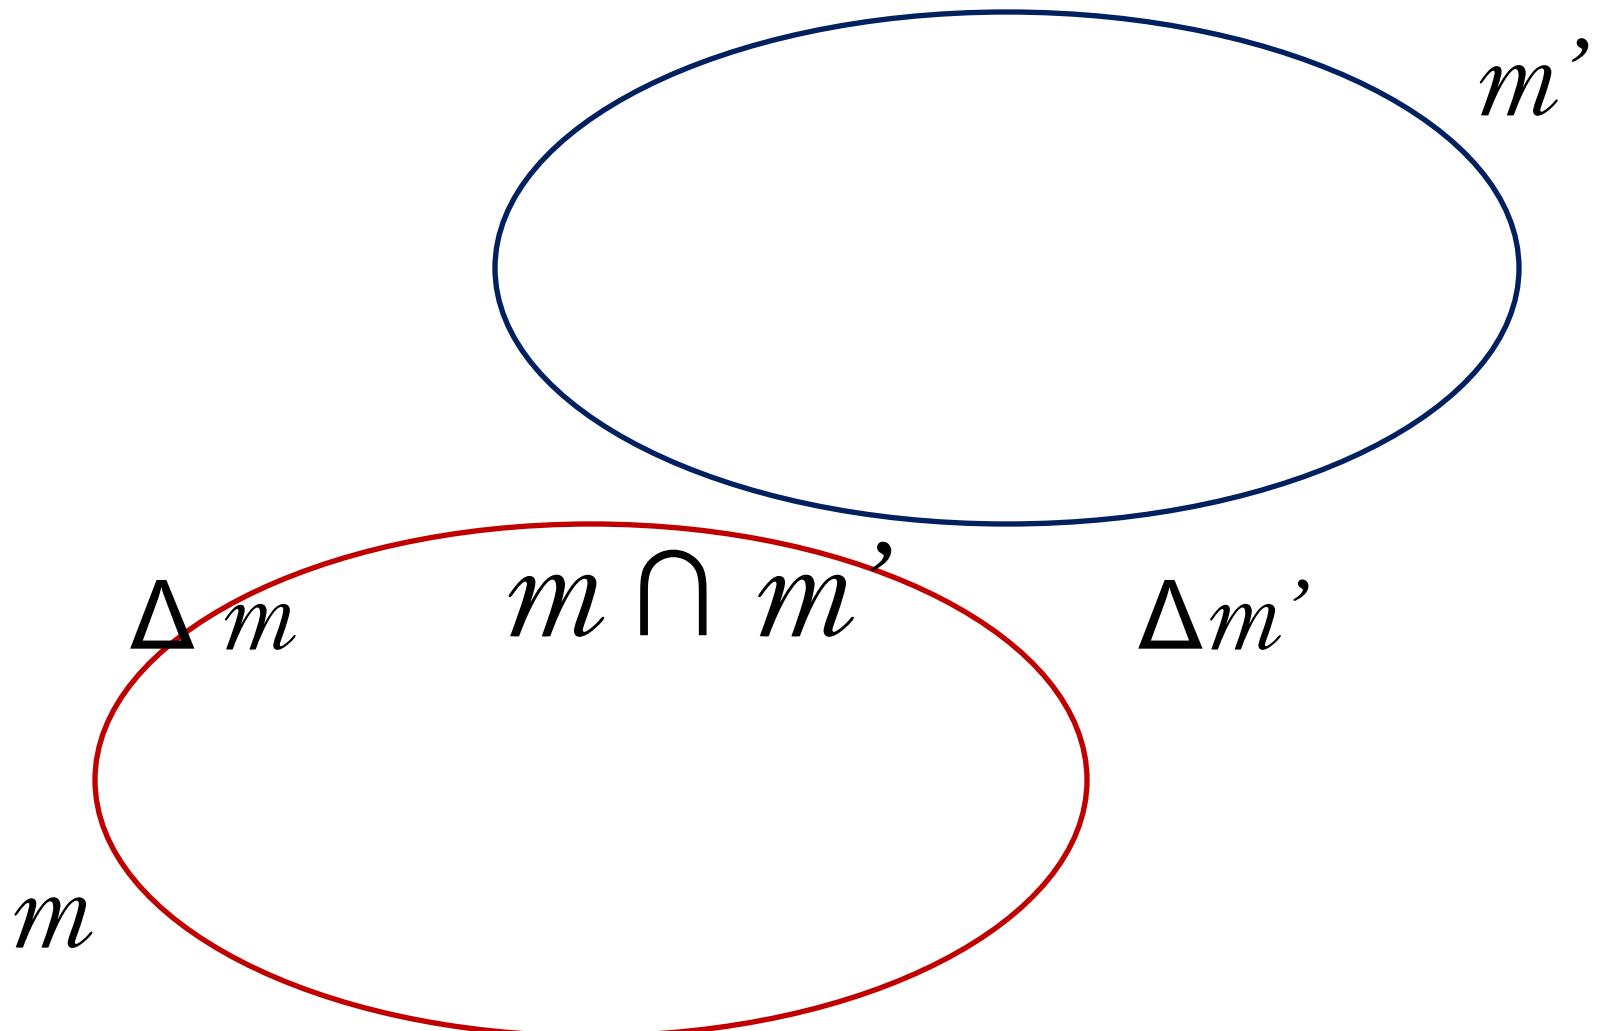

Symbolic Execution

```
int m(int y){  
1: if (y > 0)  
2:   y++;  
3: else  
4:   y--;  
5: return y;  
}
```

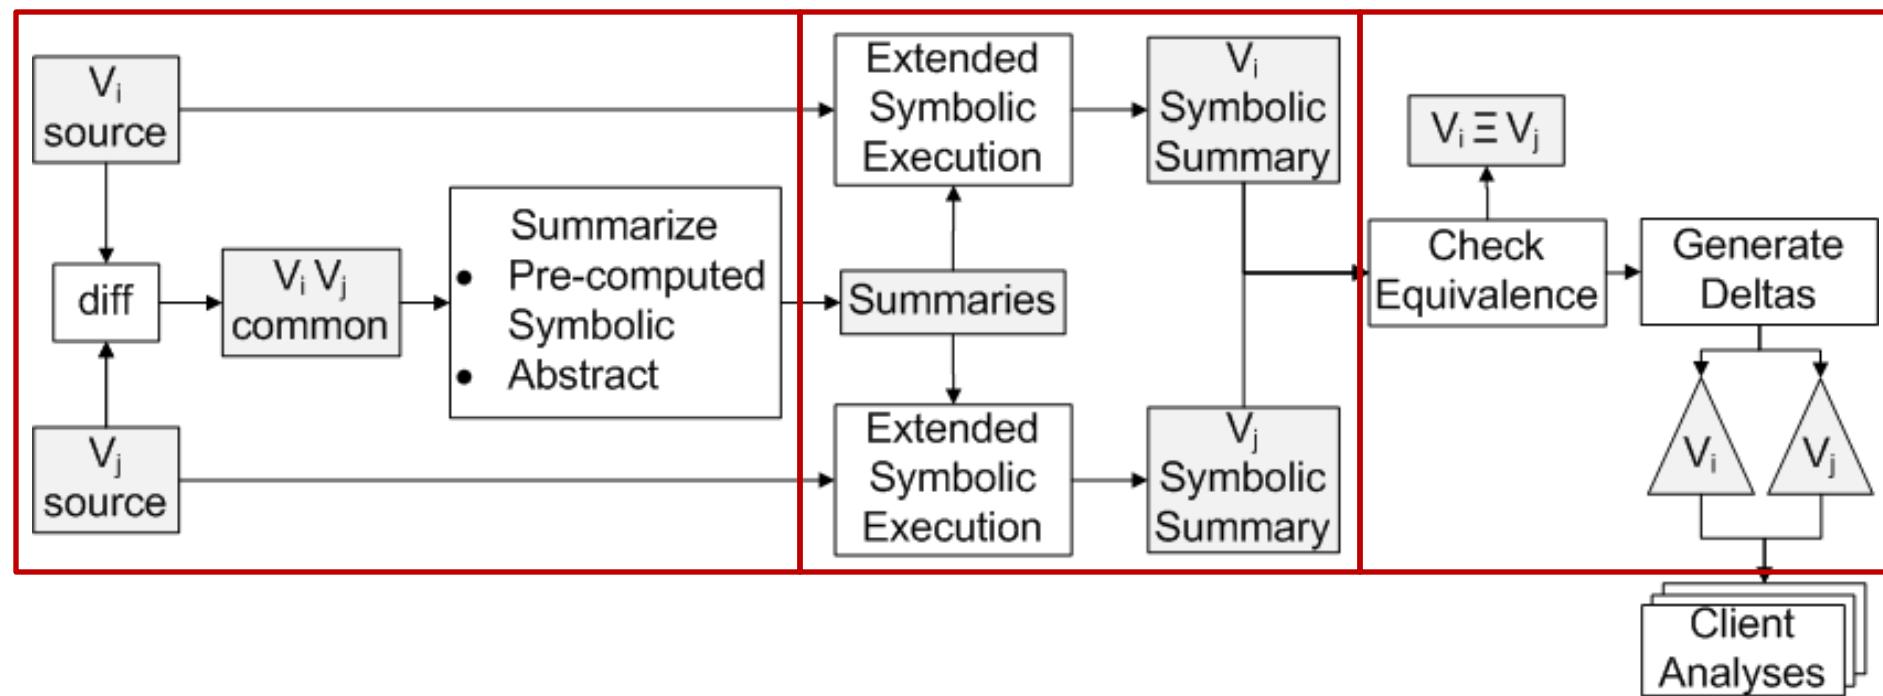

$m_{sum} =$
 $\{(Y > 0, \text{RETURN} == Y+1)\}$
 $\{!(Y > 0), \text{RETURN} == Y-1\}$

Differential Symbolic Execution

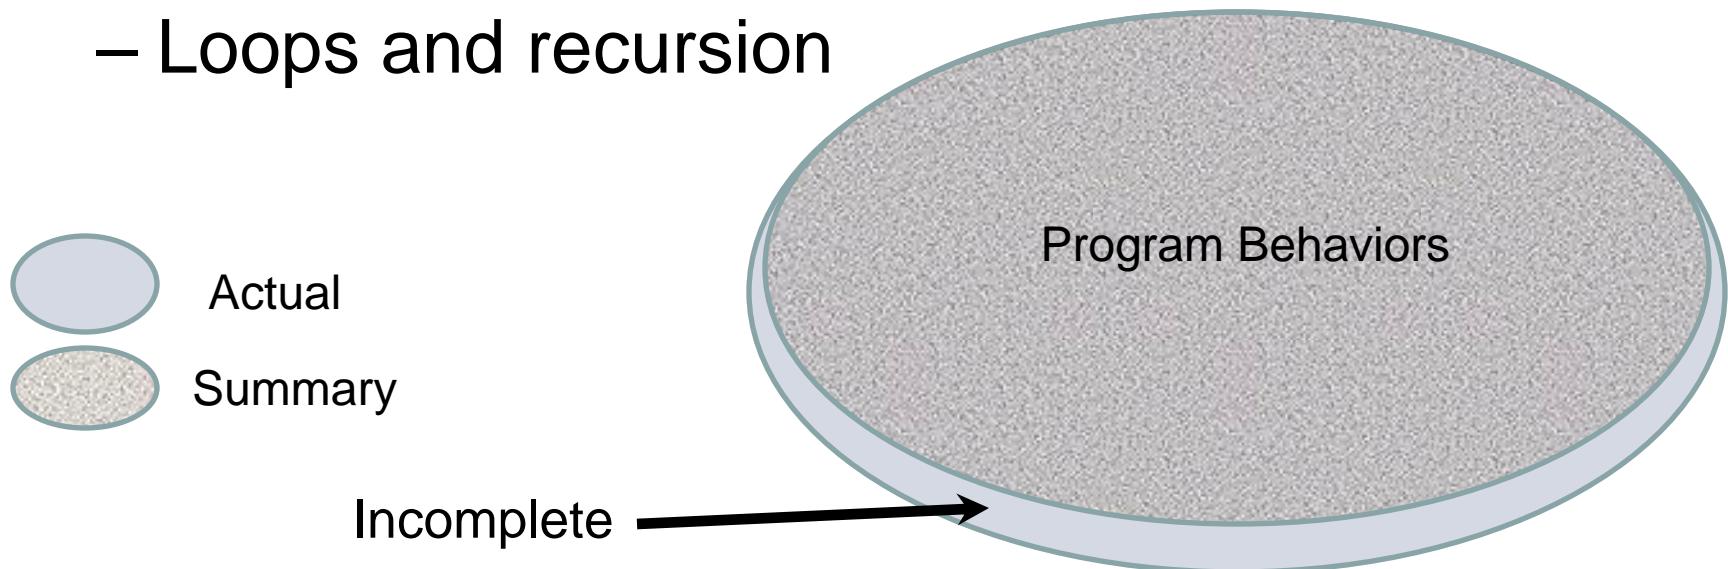

Differential Symbolic Execution

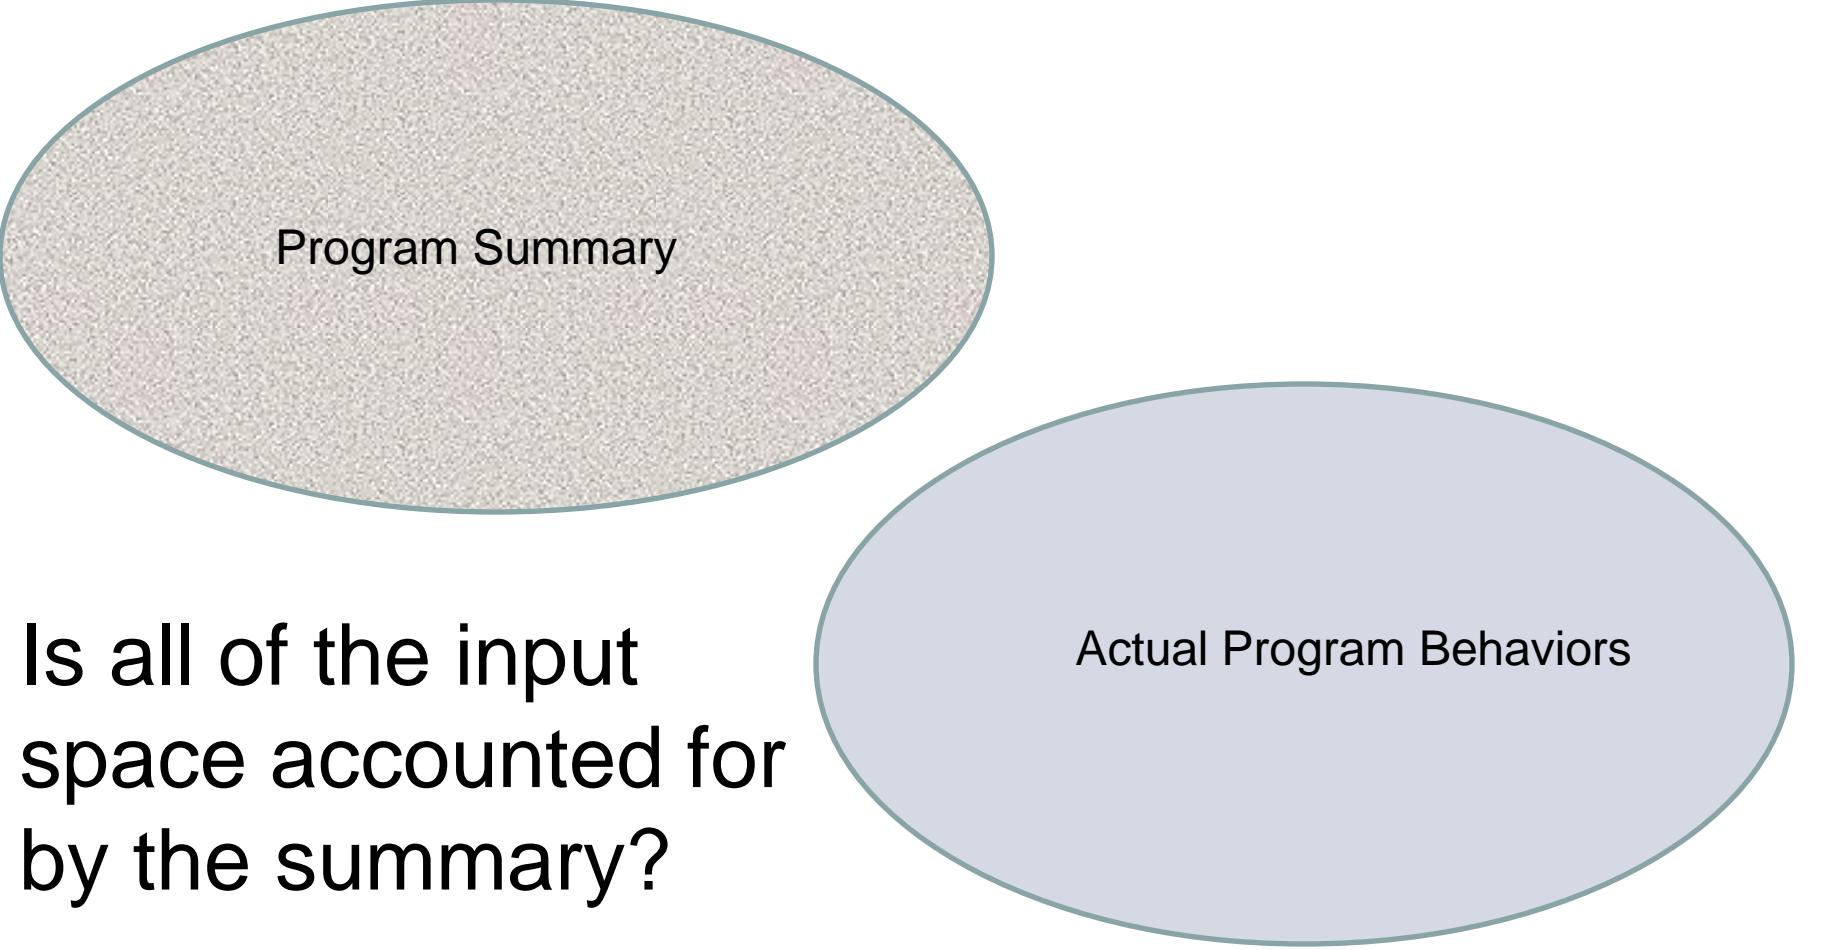

Incomplete Summaries

- It is not always possible to compute complete summaries
 - Non-linear arithmetic
 - Loops and recursion

Incomplete Summaries

Program Summary

Actual Program Behaviors

Is all of the input
space accounted for
by the summary?

Incomplete Summaries

$$m_{sum} = \{(i_1, e_1), (i_2, e_2), (i_3, e_3)\}$$

Program Summary

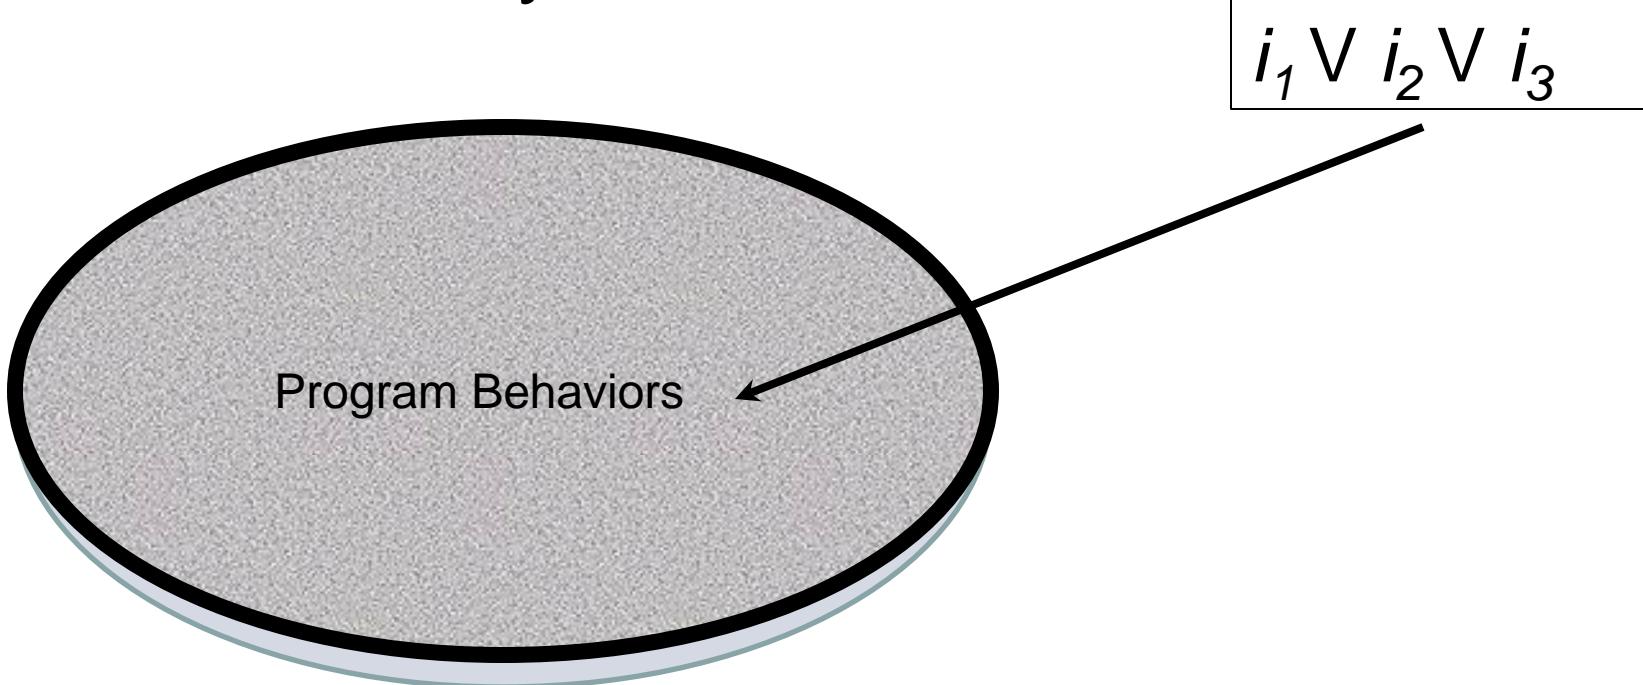

Is the disjunction of inputs valid?

$$i_1 \vee i_2 \vee i_3$$

Actual Program Behaviors

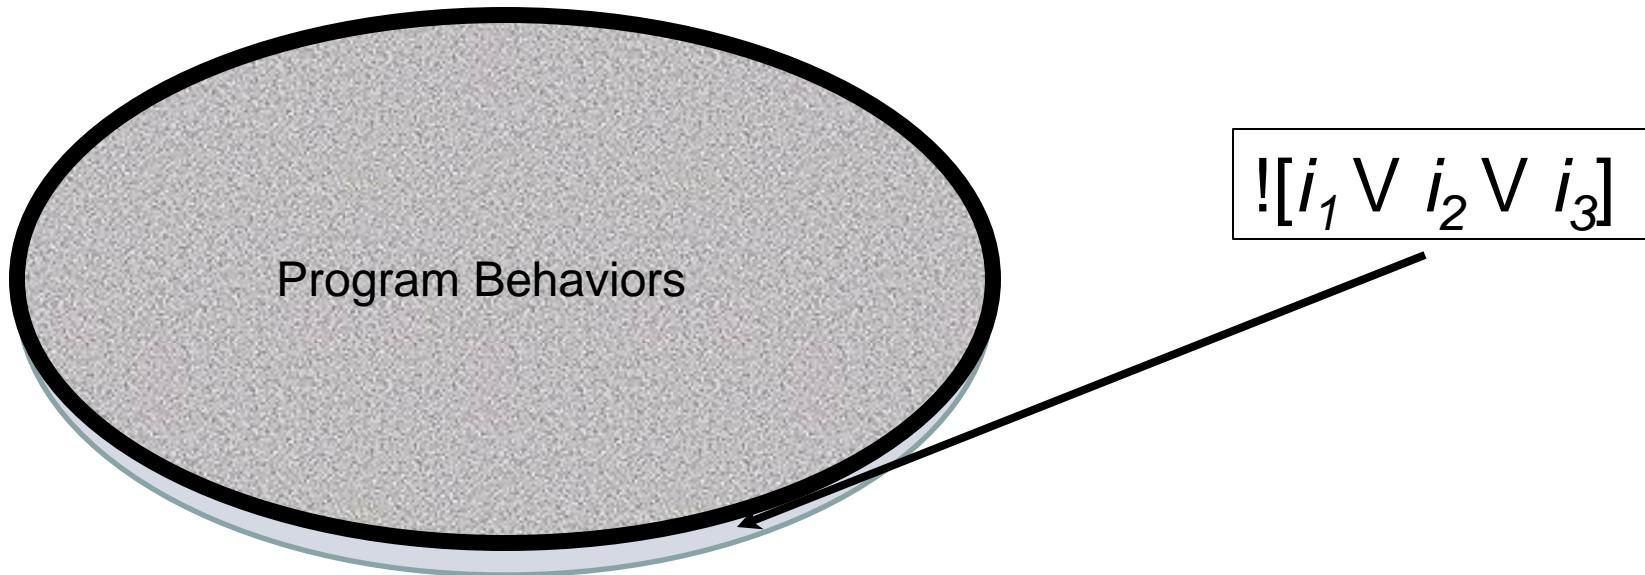

Incomplete Summaries

Explicitly define the input space covered by the summary

Incomplete Summaries

Focus subsequent analysis tool on behaviors not covered

Abstract Summaries on Common Blocks

```
void test(){ //v1  
    s1;
```

```
    s2;
```

```
    ...
```

```
for (int i=0; i<len; i++){  
    val = val + x[i];  
}  
old = val;
```

```
sn;
```

```
...  
}
```

Abstract Summary
Read set:{x,val}
Write set:{val,old}

```
void test(){ //v2
```

```
    sa;
```

```
    sb;
```

```
    ...
```

```
for (int i=0; i<len; i++){  
    val = val + x[i];  
}  
old = val;
```

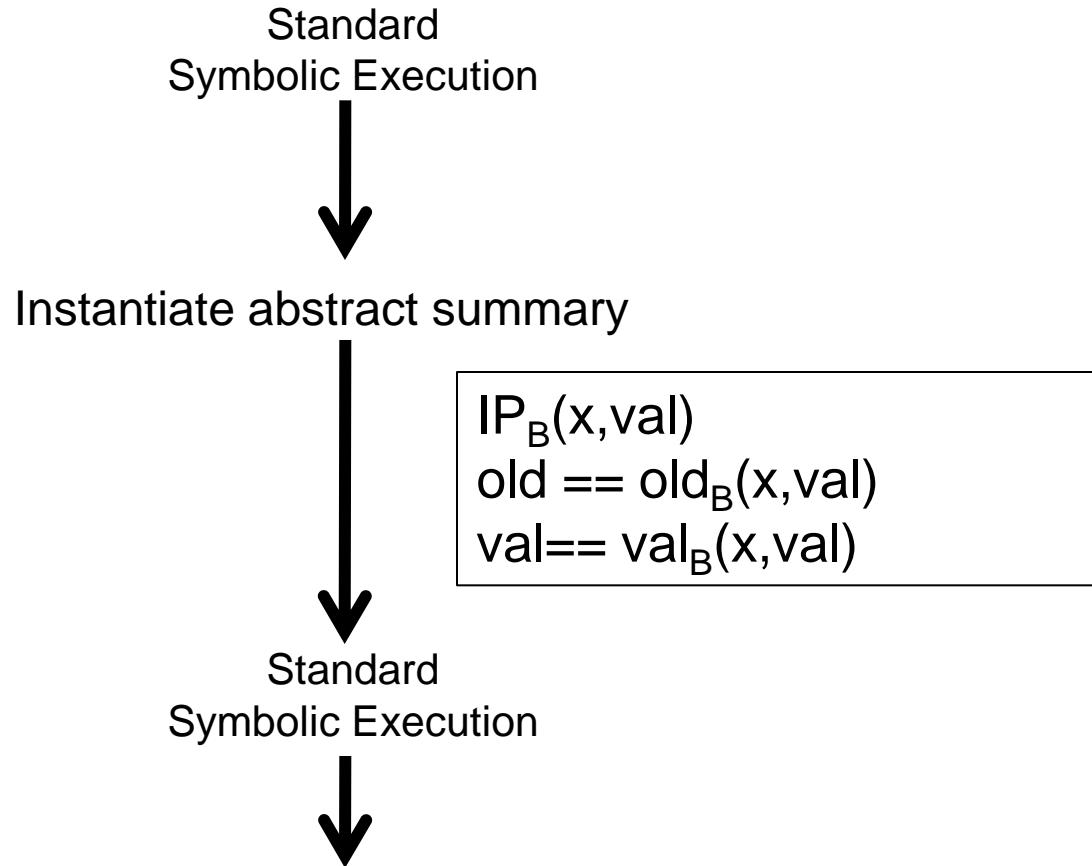

```
sm;
```

```
...  
}
```

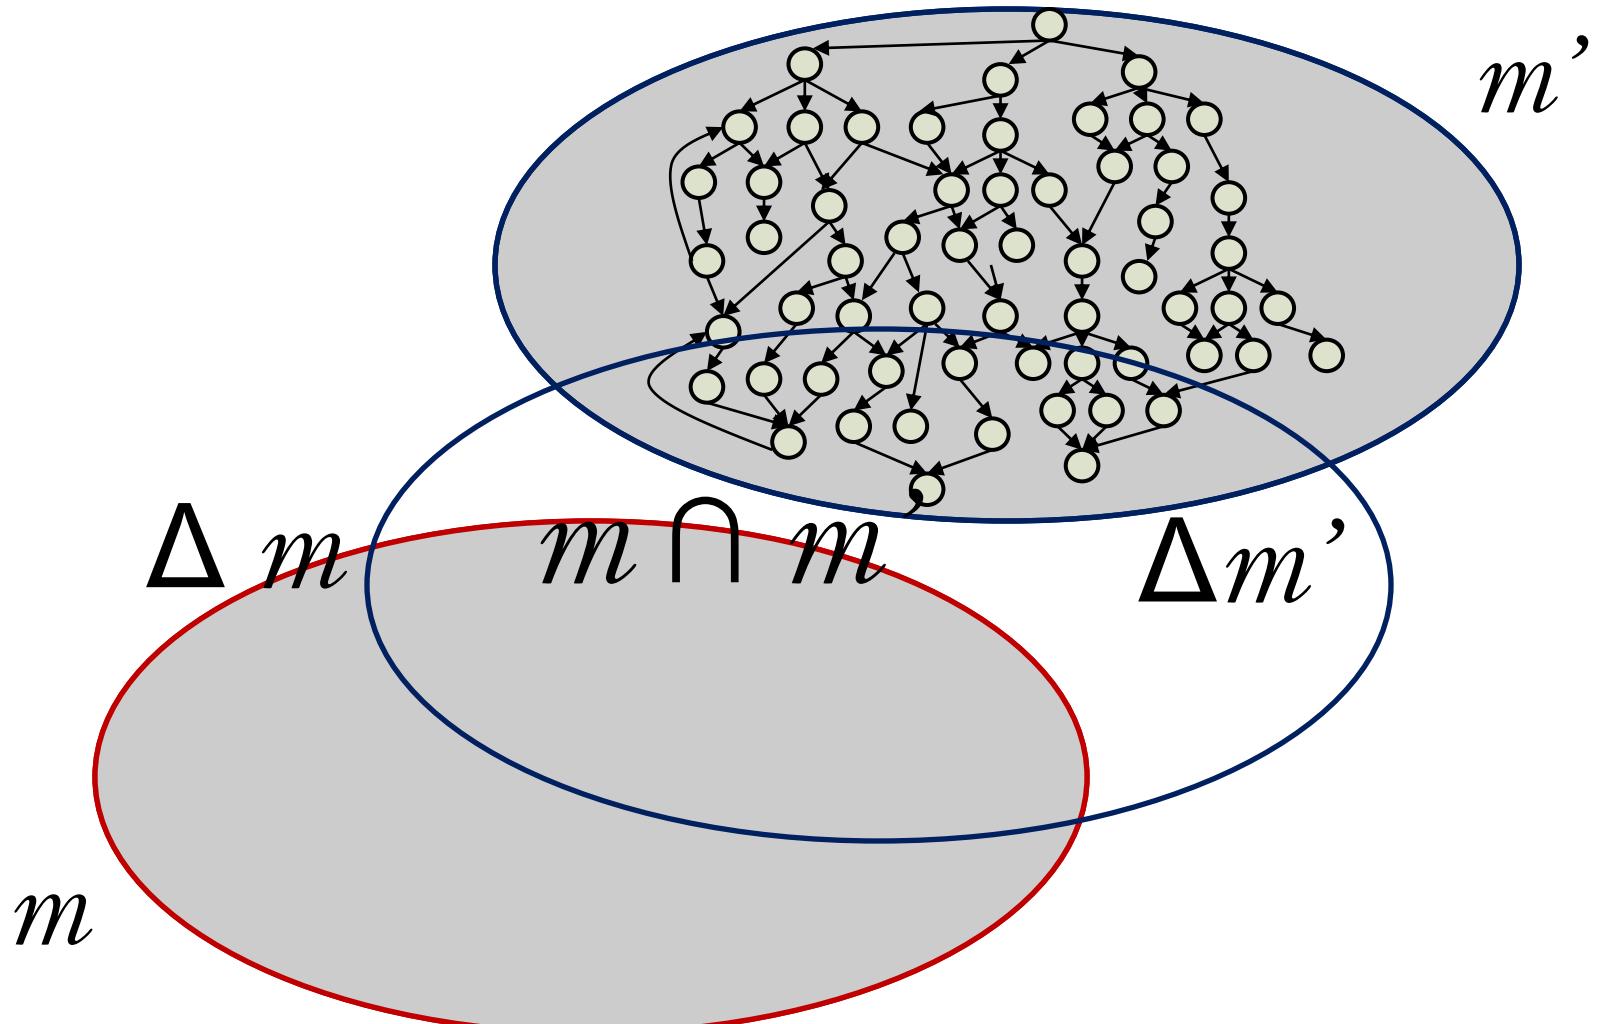

Boolean $IP_B(\text{int}[] X, \text{int val})$
int $old_B(\text{int}[] X, \text{int val})$
int $val_B(\text{int}[] X, \text{int val})$

Abstract Summaries on Common Blocks

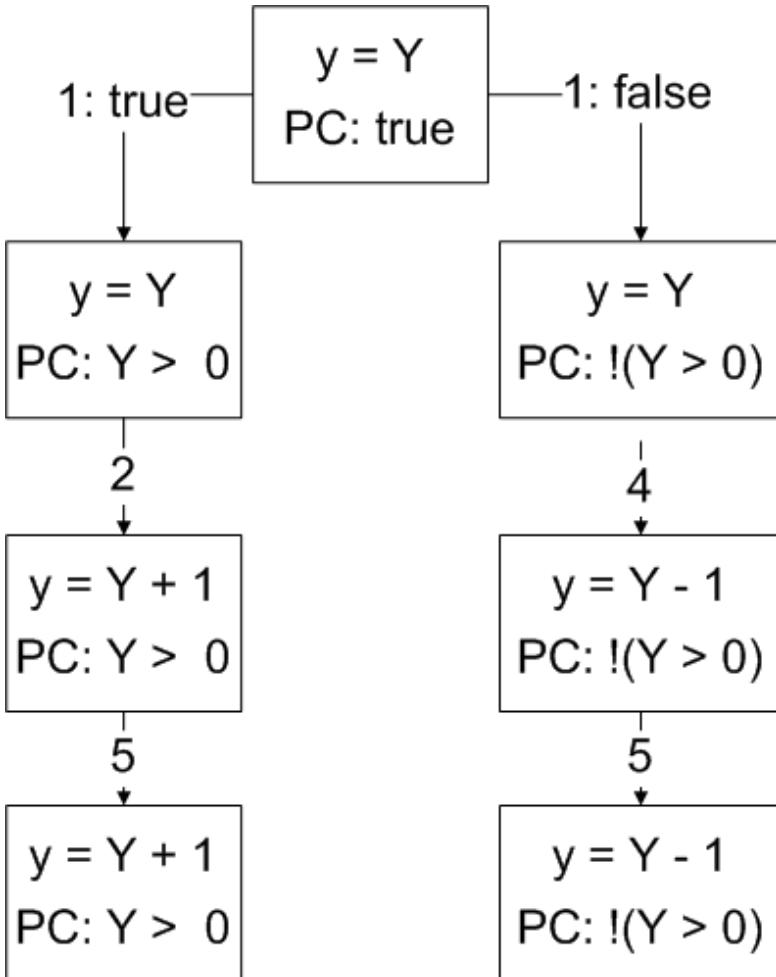

```
void test(){ //v1  
    S1;  
    S2;  
    ...  
    for (int i=0; i<len; i++){  
        val = val + x[i];  
    }  
    old = val;  
  
    Sn;  
    ...  
}
```

Functional Equivalence

Functional Equivalence

$$m_{sum} = \{(Y > 0, \text{RETURN} == Y+1), \\ (\neg(Y > 0), \text{RETURN} == Y-1)\}$$

$$m_{sum} = \\ (Y > 0 \wedge \text{RETURN} == Y+1) \\ \vee \\ (\neg(Y > 0) \wedge \text{RETURN} == Y-1)$$

Functional Equivalence

int m(int y){//v1	int m(int y){//v2
1: if ($y > 0$)	1: if ($y \leq 0$)
2: $y++;$	2: $y--;$
3: else	3: else
4: $y--;$	4: $y++;$
5: return $y;$ }	5: return $y;$ }

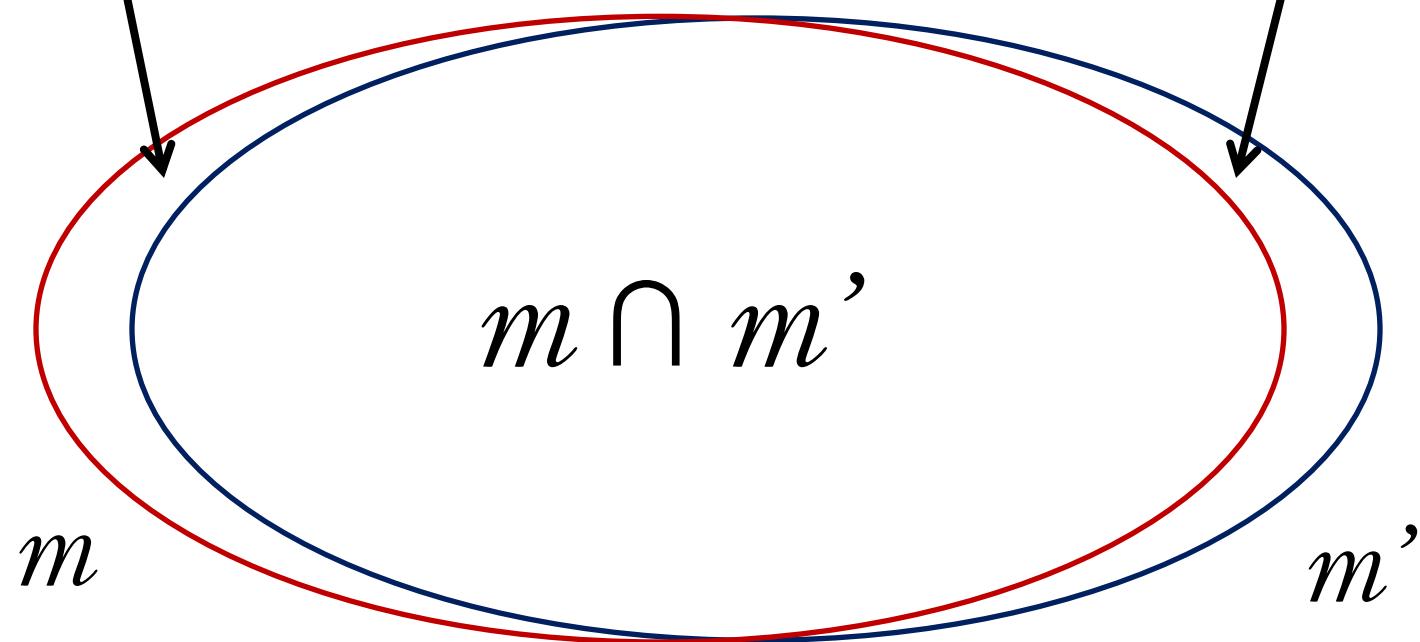

$$\begin{array}{l} ((Y > 0 \wedge \text{RETURN} == Y+1) \vee \\ (! (Y > 0) \wedge \text{RETURN} == Y-1)) \end{array} \quad ? \equiv \quad \begin{array}{l} ((Y \leq 0 \wedge \text{RETURN} == Y-1) \vee \\ (! (Y \leq 0) \wedge \text{RETURN} == Y+1)) \end{array}$$

Functionally Equivalent?

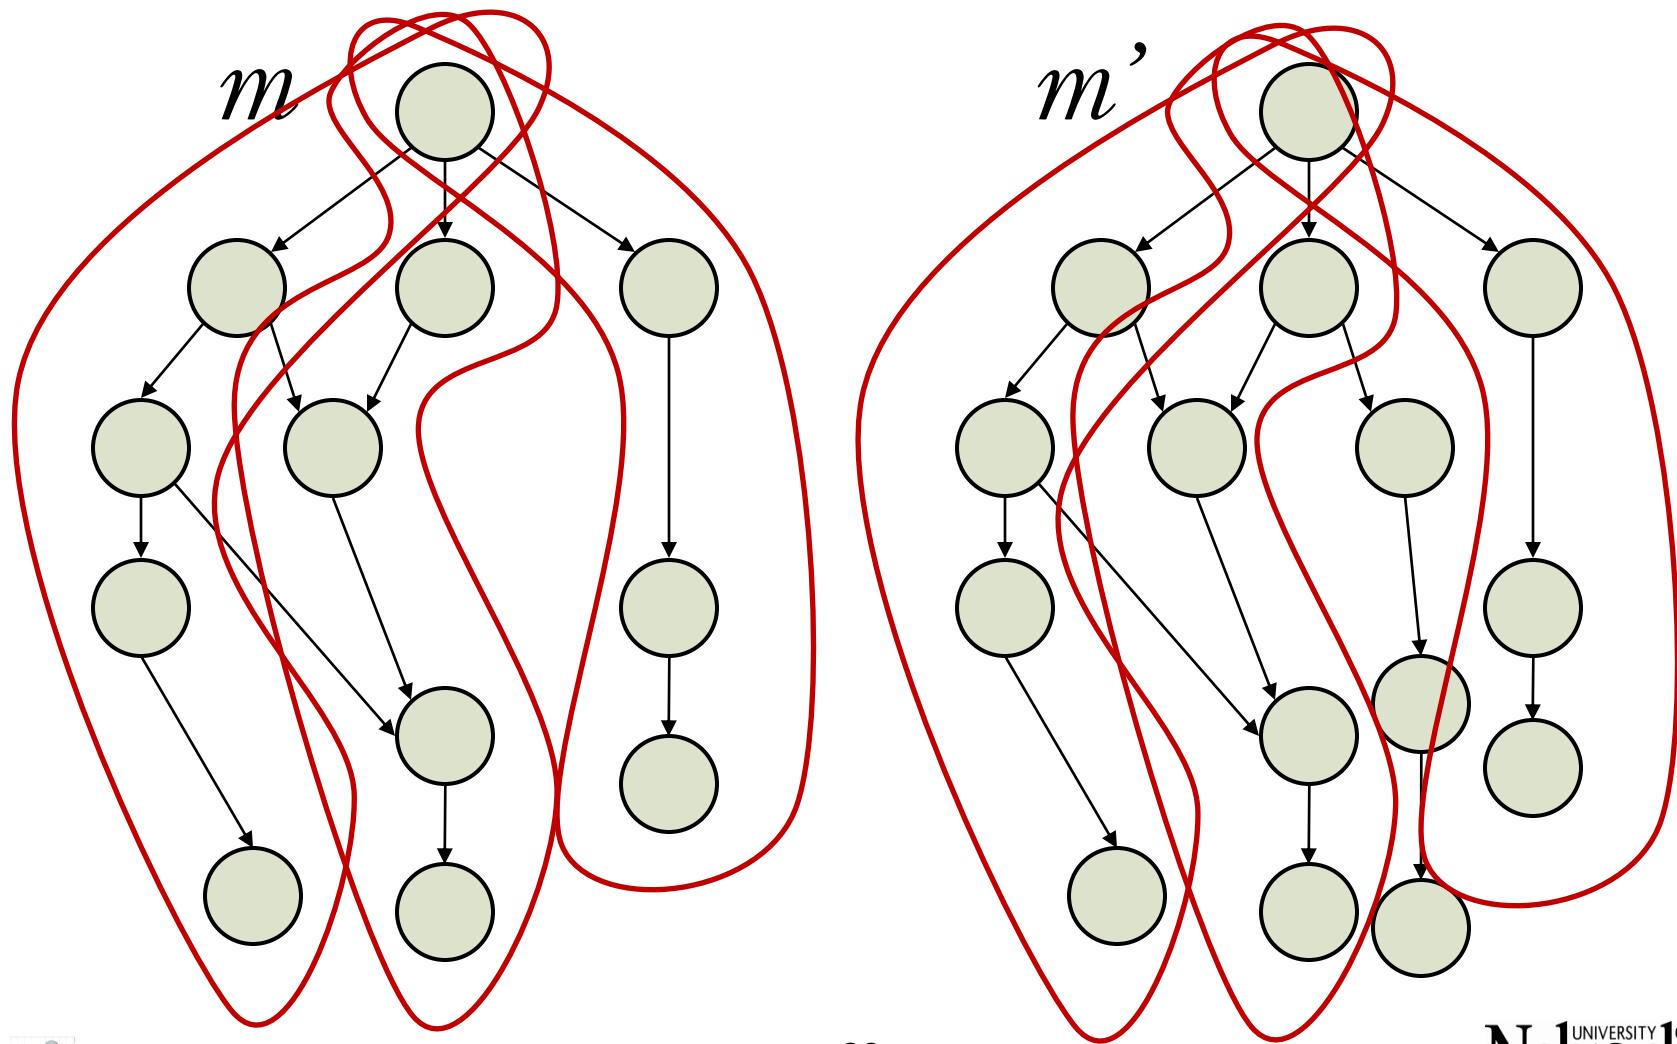

Functional Deltas

$$\Delta m = m \wedge \neg m'$$

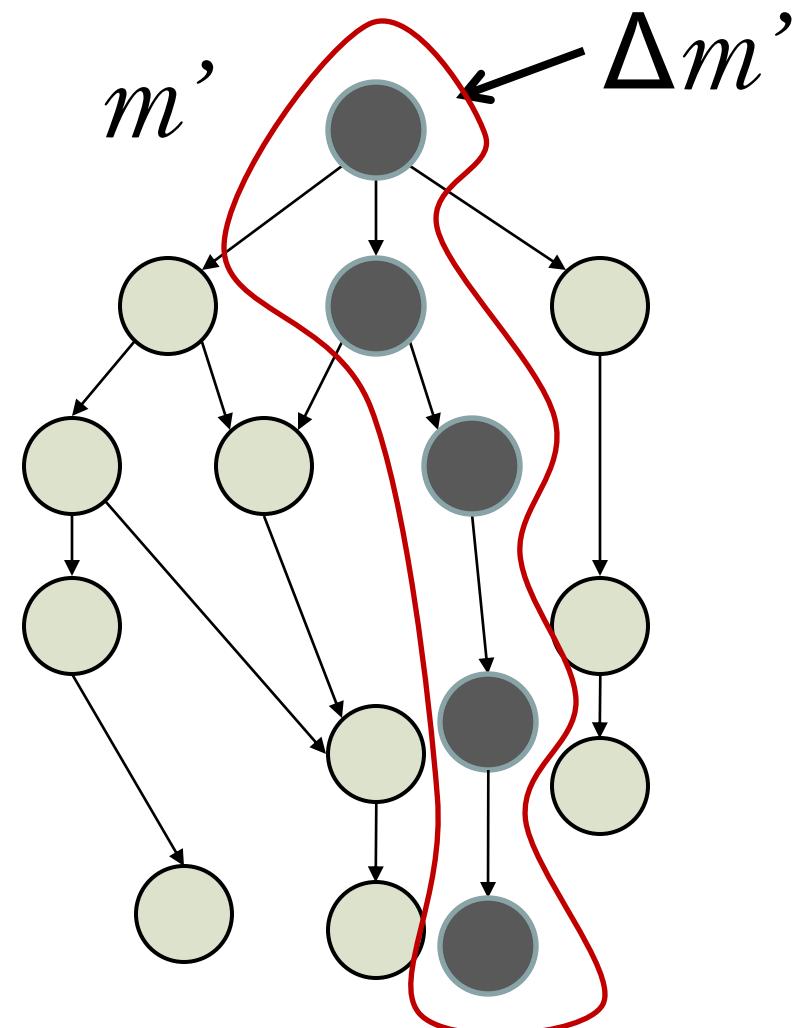

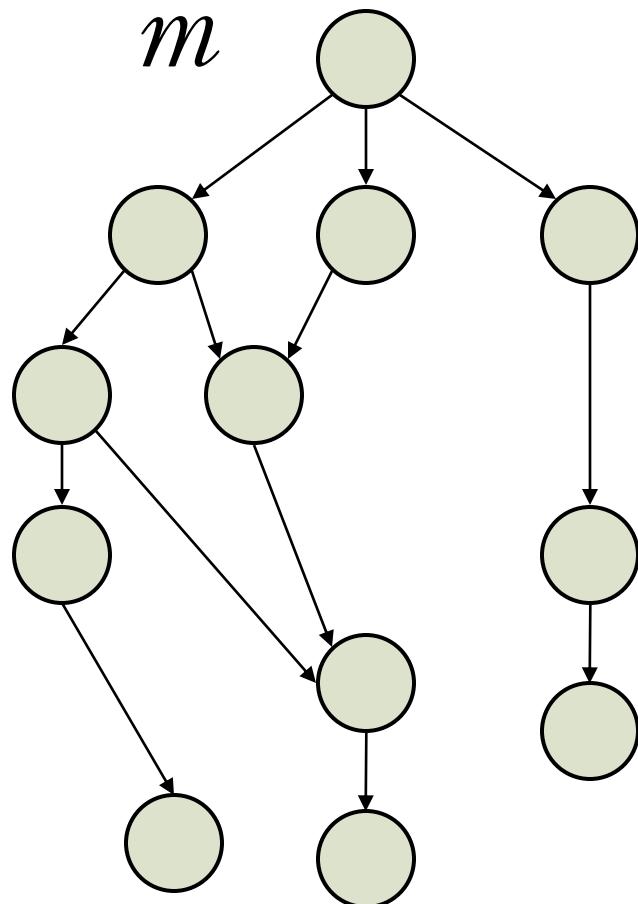

$$\Delta m' = m' \wedge \neg m$$

Partition-effects Equivalence

Partition-effects Delta

Application of DSE

- Prototype based on Symbolic PathFinder (JPF) & CVC3 theorem prover
- Applied to artifacts from SIR
 - JMeter
 - Siena
- Client applications
 - Refactoring assurance
 - Test suite evolution
 - Change characterization

Change Characterization

```
//Siena version 3
public static boolean match(byte[] x, byte[] y){
    if (x.len != y.len) return false;
    for(int i=0; i<x.len; ++i)
        if (x[i] != y[i]) return false;
    return true;
}
```

```
//Siena version 4
public static boolean match(byte[] x, byte[] y){
    if (x == null && y == null) return true;
    if (x == null || y == null || x.len != y.len) return false;
    for(int i=0; i<x.len; ++i)
        if (x[i] != y[i]) return false;
    return true;
}
```

Change Characterization

match() Version 3

Input Partition	Effect
X==null	RETURN == EXCEPTION
Y==null	RETURN == EXCEPTION
$!(X==\text{null}) \wedge !(Y==\text{null}) \wedge (X.I \neq Y.I)$	RETURN == FALSE
$!(X==\text{null}) \wedge !(Y==\text{null}) \wedge (X.I \neq Y.I) \wedge IP_{B1}(T, X, Y)$	RETURN == $\text{RET}_{B1}(T, X, Y)$

match() Version 4

X==null \wedge Y==null	RETURN == TRUE
X==null \wedge !(Y==null)	RETURN == FALSE
!(X==null) \wedge Y==null	RETURN == FALSE
$!(X==\text{null}) \wedge !(Y==\text{null}) \wedge (X.I \neq Y.I)$	RETURN == FALSE
$!(X==\text{null}) \wedge !(Y==\text{null}) \wedge (X.I \neq Y.I) \wedge IP_{B1}(T, X, Y)$	RETURN == $\text{RET}_{B1}(T, X, Y)$

Change Characterization

On input	match() Version 3	match() Version 4
$x == \text{null} \wedge y == \text{null}$	throws NRE	RETURN == TRUE
$x == \text{null} \wedge y \neq \text{null}$	throws NRE	RETURN == FALSE
$x \neq \text{null} \wedge y == \text{null}$	throws NRE	RETURN == FALSE

Related Work

Conclusion

- Differential symbolic execution precisely detects and characterizes behavioral differences between two program versions
 - Functional equivalence and deltas
 - Partition-effects equivalence and deltas
- DSE leverages program commonalities to address summary completeness

Future Work

- Further explore DSE algorithms and extend theoretical foundations
- Automate support for client applications
- Study the cost and effectiveness of DSE in automating software maintenance tasks
